Polaroid ID Card Maker SigCapture Version 1.2

This software interfaces with a Topaz SignatureGem 1x5 (T-S261) to allow a user to capture signatures with ID Card Maker software.

Installation Instructions
----

1. Install the Topaz driver from the CD-ROM that is included with the signature tablet.

2. Plug in the signature tablet.

3. Install ID Card Maker SignCapture 1.2 from the CD-ROM.

4. Run the ID Card Maker Administrator software and select Configure Capture Devices from the Capture menu.

5. Select ID Card Maker SigCapture 1.2 from the Installed Capture Devices drop down menu.

6. Click on the Test button. A licensing notification window appears.

7. Click on the Activate Button, and record User Code 1 and User Code 2. These codes need to be sent to Polaroid ID Systems to obtain the registration code.

8. Using the email or phone number provided on the Licensing window, send the two user codes to Polaroid ID Systems.

9. Once you've received the registration code, enter the code into the Reg Key 1 field on the registration window. Clicking on the OK button completes the registration process.

10. The signature capture window will now appear. To set the pen width and color, close the signature capture window and utilize the controls on the configuration utility. Changes do not take effect unless the Apply button is clicked.

Known Issues

Support for the ID Card Maker Enhanced version is limited. The transparency option will not work correctly. A signature will appear, but scaled down and unusable. To use signature capture with Enhanced, use the configuration utility with Administrator to set the background to opaque.

SigCapture 1.2 supports Windows 2000, Xp, Vista and Win 7.

SigCapture 1.2 will refuse to install if ID Card Maker is not already installed.
